Low-Data Products

Top Reorder Department

dairy eggs

Strategic Action Plan

1. **Inventory Prioritization:** Focus fulfillment optimization and stock availability on top-performing reorder categories identified by the posterior mean.
2. **Targeted Promotions:** Use Bayesian scores to identify underperforming items with high true potential, optimizing promotional spend without over-investing in volatile low-volume products.

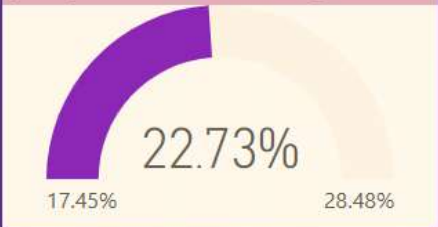

Key Insights & Methodology

- **Raw Rate vs. Bayesian Estimation:** Standard reorder rates create extreme, noisy estimates for low-volume products. Empirical Bayes posterior probabilities smooth risk-adjusted metrics to prevent anomalies from skewing rankings.
- **Top Department Stability:** High-frequency categories (Dairy & Eggs, Produce) exhibit consistent baseline reorder behavior across raw and posterior metrics.
- **Low-Data Volume Adjustment:** Products with limited order histories are pulled toward the global mean rate, ensuring decisions rely on statistically reliable signals.

Estimated Discrepancy Rate

22.73%

95% High-Density Interval (HDI) Confidence Range
